CHORRILLOS AREA PROPERTY GEOLOGY

CARTIERSILVER

- Chorrillos Project area is predominantly underlain by **Ordovician basement sediments** that have been intruded by a Tertiary-age volcanic complex of **dacites, rhyodacites, tuffs and epiclastic sediments**
- Alteration and mineralization are widespread at both properties characteristic of **intermediate to high sulphidation epithermal systems**
- Mineralization occurs in veins, stockworks and as disseminations in all rock types with **extensive argillic and silicic alteration**
- The epithermal systems are **high-level reflected** in the **predominance of silver in galena veins**
- However, **tin mineralization has been reported** in the valley suggesting that the overall **epithermal system may be zoned**

GONALBERT MINING AREA

- Consists of 10 grids covering **2.5 km^2** located **15 km southeast of Iska Iska**
- **Small artisanal mine** recovering high grade silver from a galena vein. Production reported to be **20 tpd at ~200 g Ag/t** with concentrate grade of **1,300 g Ag/t**
- Property is underlain by Miocene-age dacitic domes and dikes which have **intruded basement Ordovician sediments**
- Mineralization likely part of an **extensive intermediate to high-sulphidation epithermal system**

Dr. Osvaldo Arce, Dr. Bill Pearson and Marcelo Alvarez at Sajona Mine, Gonalbert Property

GONALBERT MINING AREA

GONALBERT **EPITHERMAL MINERALIZATION**

"The Gonalbert zone is a **Bolivian-type caldera hosted, polymetallic silver-dominant epithermal vein system,** associated with **Ordovician slates, and Miocene dacitic domes, dykes, and lithic tuffs.**

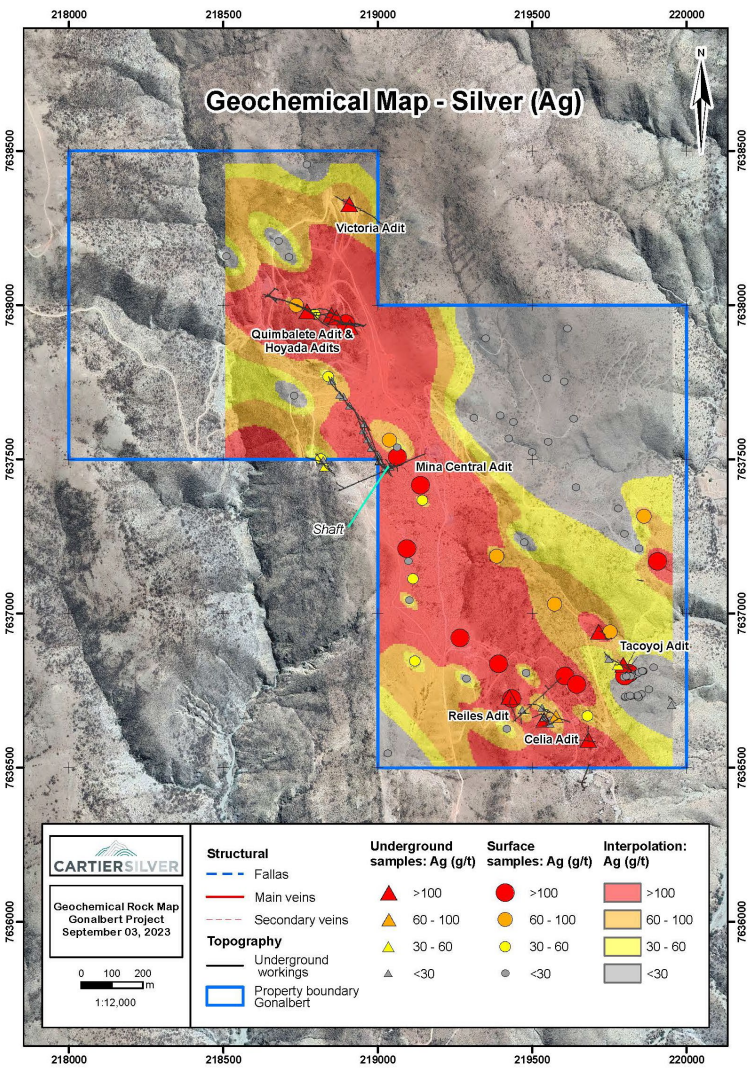
Vein-type and disseminated Ag-Zn-Pb mineralization occur in **subvertically continuous fault hosted veins, and replacements of brecciated faults**.

The widest and highest-grade veins are present in northwest trending faults which are readily evident in the geological and geophysical data."

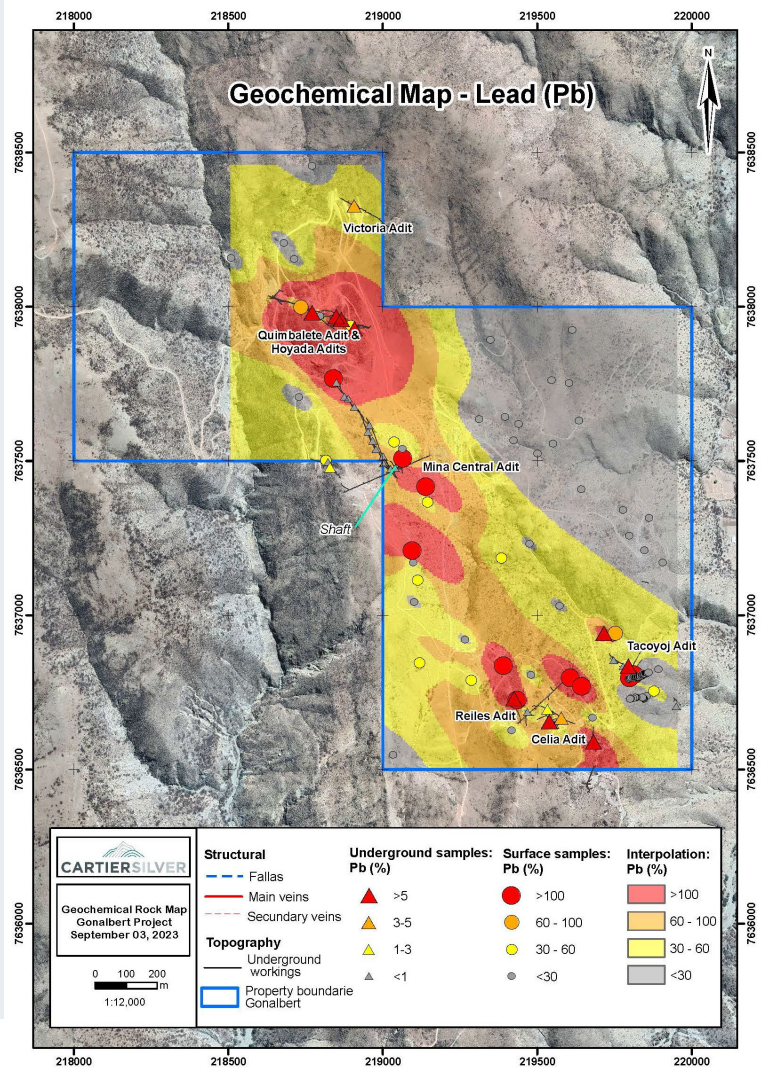
Dr. Osvaldo Arce, P.Geo., General Manager of Cartier Silver's Bolivian subsidiary, Minera Cartier S.R.L. and an expert on metalliferous deposits in Bolivia

STRONG GEOCHEMICAL TREND AT GONALBERT

SILVER (Ag)



LEAD (Pb)



Ag-Pb-Zn mineralization is associated with north-northwest trending structures readily inferred from the IP/Res and topographic surveys.

Principal trend of mineralization is 310-330 degrees parallel to a set of north-northwest trending quartz dykes.

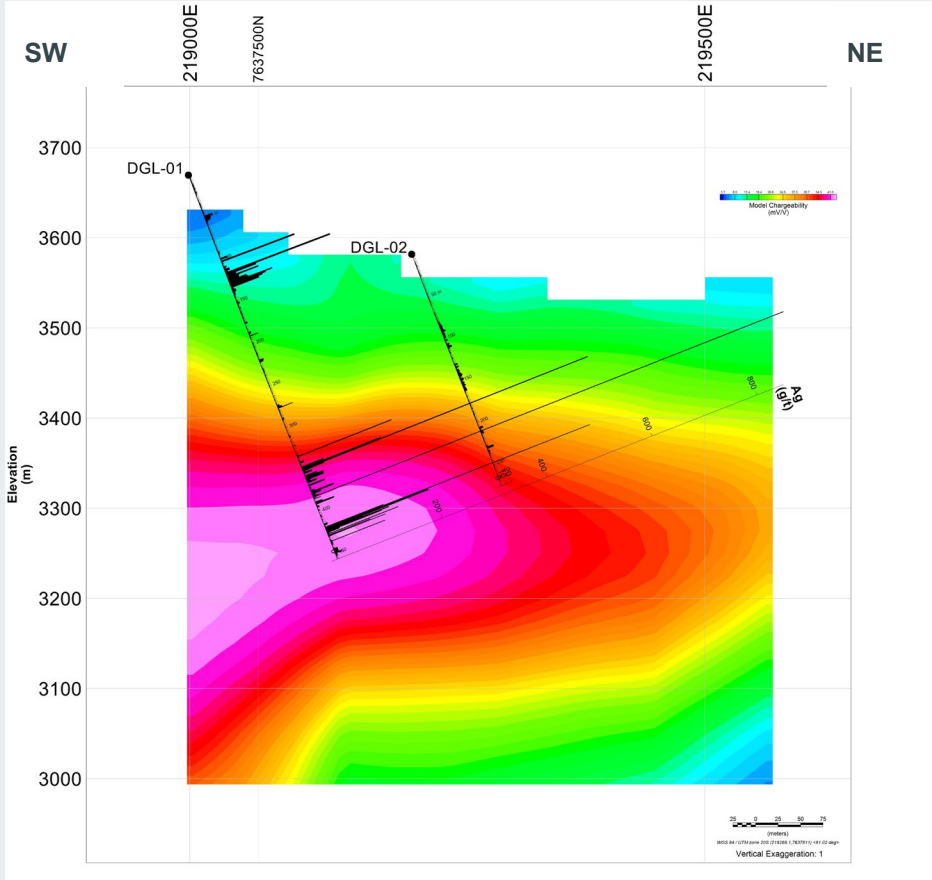
CHARGEABILITY WITH DRILLHOLES



Geophysical data suggest that the **chargeable mineralization becomes stronger with depth,** reaching a maximum at the 400 m limit of the IP/Res survey.

- Chargeable mineralization coincides with the **enhanced conductivity along both fault traces**
- **Chargeability becomes stronger** at depths greater than 100 m, below a depleted, near-surface zone where **sulphide mineralization has been extensively oxidized**
